Focus on places that rabbits like to use.

The key to long-term rabbit control is to remove the places where rabbits are breeding.

- Rabbits have areas where they feed, and places where they hide.
- Rabbits usually run away and seek cover when disturbed.
- Disturbed rabbits may run to the nearest cover or they may run to their actual 'home'.
- Rabbits prefer to dig burrows in the ground but this can take time depending on soil type. Burrows enable successful breeding.
- In the absence of burrows, rabbits will get under things that offer them protection from predators.
- Rabbits are often found around man-made structures or disturbed habitat.
- Removing breeding places often requires:
 - Burning or removing log-piles or rubbish piles;
 - Raising materials off the ground;
 - Using barriers such as wire netting to block rabbits from getting under things.
- Removing breeding places is the responsibility of land-holders.

↑ In rubbish piles.

↑ Under log-piles.

↑ In mounds of soil mixed with timber.

↑ Under low-set buildings.

↑ Under concrete slabs.

↑ Under shipping containers.

↑ In weeds like lantana and boxthorn.

↑ Along creek banks.
