

Have you got a rabbit problem?

HERE'S WHAT TO LOOK OUT FOR:

Finding where rabbits live is an important first step for controlling one of Australia's worst agricultural and environmental pests.

Rabbits seek two basic things:

Short green grass to eat

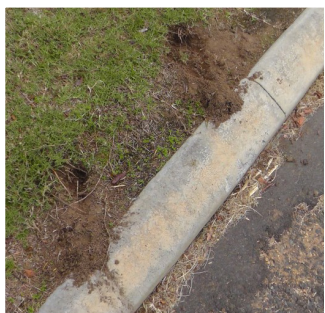

Somewhere nearby to shelter

Top tips:

- Rabbit signs are often easiest to find in bare areas such as garden beds or sprayed areas under fence lines.
- Using a spotlight or powerful torch to look for rabbits at night can help estimate how many there are and where they run to hide.
- The key to long-term rabbit control is to remove the places where they are breeding.

Are you a landholder?

Under The Biosecurity Act 2014 you have an obligation to control rabbits on your property. You know your land better than anyone else, so you're the best person to protect it.

Fresh scratchings

Dark, fresh droppings ("pills")

Entrance under objects on the ground

An active burrow (fresh soil, tracks & pills)

Lots of scratchings

A large dung pile ("buckheap")

A disused burrow

A network of burrows ("warren")
